

A dimension coordinate construct indicates the physical meaning and locations of the cells for a **unique domain axis** of the field.

An auxiliary coordinate construct provides auxiliary information for interpreting the cells of an **ordered list of one or more domain axes** of the field.

A cell measure construct provides information about the size, shape or location of the cells defined by an **ordered list of one or more domain axes** of the field.

The **value** of each **term** may be a scalar parameter, one of the dimension or auxiliary coordinate constructs, or another field construct.
